

# Compare your diagnosis with a million others. PenProfiler.

## **Does your Mammography Information System offer the newest dimension in diagnosis?**

The exclusive PenRad Profiler instantaneously mines facility data and PenRad's national database for pathological outcome by matching abnormality attributes for mammography, ultrasound and breast MRI examinations. Match your diagnosis with over a million studies and compare with over 100K biopsy proven results. The outcome and quantity are displayed for comparison for local and national databases. As attributes of an abnormality are selected, the Profiler button displays the count of matching abnormalities with pathological outcome. The Profiler displays the number of malignancies and benigns and the total number of matching abnormalities in the database. Individual quantity percentages are listed for benign and malignant outcomes.

You can even select to display matching exams to your workstation. Tapping the export to workstation button enables our PenFetch module to bring matching exam images to the reading workstation for further research and/or investigation. Only PenRad offers this exclusive diagnostic feature. The PenRad Mammography Information System is the most advanced system available in the market.
