## Collecting patient data for risk assessment and genetic testing eligibility

PenRad, PenTrac, and PenLung systems offer a tablet software allowing patients to refresh pertinent data for personal history and family cancer history to calculate risk assessment values and genetic testing eligibility.

For mammography, all necessary forms are populated with historical data.

Time-based forms (release and HIPAA consent) are automatically included when refresh is necessary to capture the patient's electronic signature.

Consent forms for invasive procedures can also be easily presented for signature capture.

Informative movies about procedures can support increased technologist throughput, provide answers and inform while reducing patient anxiety.

Increase the benefits by adding additional Informative movies on your other services offered.

Information automatically derived from patient and relative's data, risk values and eligibility for genetic testing are computed, this includes the patient breast density factors.

This creates additional value for patient and relatives with little effort for the facility.

For the facility, this provides expanded imaging services and genetic consulting referrals.

With PenRad automated tools and our built-in navigator system, we provide the foundation for a high risk breast center.

Interested in other mobile and remote solutions for increased productivity, give us a call.
