

PenTrac Options

Those with PenTrac now have more options for workflow. For those clients that use PenTrac just to “Track”, and elect to dictate reports, we offer other options to increase professional productivity.

Basic PenTrac package:

Entry level PenTrac clients manually enter tracking points and collect the patient medical and risk cancer information. The radiologist typically dictates and receives a paper history/risk worksheet updated by tech and or the patient, a possible scanned copy of it coupled to the images manually. The radiologist hunts for the prior exam narratives and has a need to have a separate PeerReview session.

AutoReader option:

Adding our autoreader module extracts the high level tracking points out of the narrative to automate tracking. This eliminates the look-up of the exam and manual data entry. Requires HL7 result message.

Send to PACS option:

Adding our “Sent to PACS” module automatically attaches an electronic version of the history/risk worksheet coupled to the images. Also, it can attach copies of the patient exam and reminder letters, and the order if desired. Requires our DICOM engine.

Electronic survey option:

Some PenTrac and PenRad clients add our patient tablet module that allows either the tech or patient to electronically update patient history/risk and update their consent forms, HIPAA, and enroll into email delivery service “PenConnect”, to reduce facilities mailroom expense.
